EXPERTISE

- Backend: Go (Gin, GORM), Rust, Python, Node.js
- Database: MySQL, Redis, Atlas, CDC (Debezium), Graph DB
- Cloud/DevOps: AWS (Cognito, S3, OTel), Docker, Kafka, CI/CD
- AI/ML: LLMs (OpenAI, Gemini), LangChain, LlamaIndex, Vector DB, Ragas, XGBoost
- Frontend & Tools: WASM, Playwright, Swagger, Zerolog

EDUCATION

- Chung Yuan Christian University (CYCU)
- Engineering/Computer Science related

LANGUAGES

CERTIFICATIONS

- AWS Certified Solutions Architect – Associate
- Gemini certified student

Professional Summary

Proactive, backend-focused engineer with experience across Cloud, DevOps, AI, and Frontend development. Specialized in high-performance infrastructure, ReBAC engines, and AI-driven workflows.

Professional Experience

Software Engineer / Backend Engineer Aug 2023 - Present

Fortune Fantasy Global Tech .Ltd (Graid Technology)

Leading backend infrastructure development for high-performance SupremeRAID™ NVMe solutions. Focused on scalable architecture, secure integrations, and database optimization.

- Built backend infrastructure and DB schema for complex business logic in alarm management systems.
- Optimized MySQL index creation, reducing response times from 50s to 3s for critical queries.
- Developed real-time monitoring APIs using Go (Gin) and GORM with multi-tenant data isolation.
- Integrated AWS Cognito and custom JWT middleware for secure RBAC (Role-Based Access Control).
- Automated schema migrations and versioning across MySQL using Atlas and GORM.
- Architected secure Webhook and API Key systems for third-party integrations and automated reporting.
- Standardized API documentation with Swagger and implemented structured logging using Zerolog.
- Containerized applications with Docker and automated deployment using Makefiles and Shell scripts.

Key Projects

AuthZ (Authorization Engine)

Real-time, Zanzibar-inspired ReBAC engine supporting complex, recursive permission schemas.

- Architected a ReBAC engine supporting RBAC/ABAC, achieving 10k+ RPS with sub-1ms median latency.
- Engineered a memory-first, sharded graph architecture to eliminate lock contention.
- Optimized DB performance using Redis-backed Cuckoo Filters to slash duplicate lookups.
- Built an event-driven state synchronization pipeline using Kafka and Debezium (CDC).
- Integrated OpenTelemetry (OTel) for distributed tracing and metrics in high-throughput environments.

RAG (Retrieval-Augmented Generation)

Modular RAG pipeline integrating vector storage and LLMs for high-accuracy contextual retrieval.

- Engineered a pipeline using LangChain and LlamaIndex with ChromaDB for vector storage.
- Optimized search recall via hybrid search (Semantic + Keyword) and Cohere Rerank, reducing hallucinations by 40%.
- Developed an automated evaluation framework using Ragas to measure faithfulness and relevancy.

Vistrace

High-performance network scanner and AI-driven TDD logic execution environment.

- Engineered a high-performance ARP/DNS/ICMP scanner in Rust, optimizing the WASM pipeline.
- Architected an AI-driven Agentic Workflow (OpenAI/Gemini) to autonomously execute TDD logic.
- Developed 12+ custom Rust CLI tools to automate 80% of repetitive local setup tasks.
- Achieved 95%+ test coverage and 100% automated doc sync using Playwright/Rust.
- Integrated generative AI pipelines to reduce asset production time and costs by 50%.

Predictive Analytics for League of Legends

Tree-based model for identifying high-probability winning strategies.

- Engineered a predictive engine using XGBoost and LightGBM, achieving an AUC-ROC of 0.88.
- Implemented SHAP/LIME for model interpretability and team draft optimization.
- Developed a real-time data ingestion system using Python and Riot Games API for telemetry streaming.
